Weather Application

Weather website

Using Bootsrap, create a weather website that will retrieve the weather forecast for the next 16 days using Open Weather API:

https://openweathermap.org/

Use the following appID: 9fd7a449d055dba26a982a3220f32aa2

Show the following result in tables : Date, Temperature, Image, Text.

The retrieving data from API code to be done using Angular or VueJS, or Jquery.

When the table is pressed, show more information of the weather: Pressure, Humidity, Description

Going Beyond (Google IT!)

Add Geolocation function that will show the weather based on user's location

Add a "Save" button from each item on the table to save the data in local storage. (Looks for local storage function)

Add another table "My Saved date" that will show all the saved date data and it's weather.
